The paper gives an overview of the innovative field of hybrid energy storage systems (HESS). An HESS is characterized by a beneficial coupling of two or more energy storage technologies with supplementary operating characteristics (such as energy and power density, self-discharge rate, efficiency, life-time, etc.).

Additionally, energy storage technologies integrated into hybrid systems facilitate surplus energy storage during peak production periods, thereby enabling its use during low production phases, thus increasing overall system efficiency and reducing wastage [5]. Moreover, HRES have the potential to significantly contribute to grid stability.
