inductor, flux $L \cdot i$.
2. Calculate the Thevenin resistance it sees connected to it. That sets the R value for decay.
3. Establish the initial condition (Q or $v_C(t)$) for a capacitor, L or $i_L(t = t_0)$ for an inductor.
4. Replacing a capacitor with a voltage source with strength $Q/C = v_C(t)$ or an inductor with a current source with strength $L/L =$

Inductors, capacitors, and batteries are all utilized as energy storage components but operate based on different principles. Inductors store energy in magnetic fields created by current flow, whereas capacitors store energy in electric fields formed between their plates.

Inductors and Capacitors We introduce here the two basic circuit elements we have not considered so far: the inductor and the capacitor. Inductors and capacitors are energy storage devices, which means energy can be stored in them. But they cannot generate energy, so these are passive devices. The inductor stores energy in its
