In conclusion, inductors store energy in their magnetic fields, with the amount of energy dependent on the inductance and the square of the current flowing through them. The formula ($W = \frac{1}{2}LI^2$) encapsulates this dependency, highlighting the substantial influence of current on energy storage.

Use the following formula to calculate the energy stored in an inductor: $[W = \frac{1}{2}LI^2]$ where. W = energy in joules. L = inductance in henrys. I = current flow in amperes. This energy is stored in the electromagnetic field while the current flows but released very quickly if the circuit is turned off or power is lost.
