Batteries and renewable generation essentially share carbon savings from reduced inertia. Batteries help the grid remain stable at low inertia, but renewable generation lowers inertia in the first place. This shift to a lower inertia grid began in 2023, which is why there is such a large increase in inertia emissions savings after 2022.

supply and demand. Inertia emulation techniques using storage systems, such as flywheel energy storage systems (FESSs), can help to reduce the ROCOF by rapidly providing the needed power to balance the grid. In this work, a new adaptive controller for inertia emulation using high-speed FESS is proposed.
