The reversible redox reactions of metal oxides show high potential as thermochemical storage material. At high temperatures oxides of suitable transition metals will undergo a reduction reaction and by that thermal energy is absorbed ($M \times O_y + z \rightarrow M \times O_y + z/2 O_2$ ($M = \text{Metal}$)). Below specific equilibrium temperatures the reoxidation ($M \times O_y + z \rightarrow M \dots$

Iron (III) oxide is a compound that appears in at least four different polymorphs: α -Fe₂O₃, γ -Fe₂O₃, δ -Fe₂O₃, and ϵ -Fe₂O₃. However, Fe³⁺ ions are also present in another form of iron oxide: Fe₃O₄, which is an iron crystal structure with both Fe²⁺ and Fe³⁺ ions. And in its turn, Fe²⁺ ions are also present in the FeO form of iron oxide. Each of these ...
