Hydrogen can be stored physically as either a gas or a liquid. Storage of hydrogen as a gas typically requires high-pressure tanks (350-700 bar [5,000-10,000 psi] tank pressure). Storage of hydrogen as a liquid requires cryogenic temperatures because the boiling point of hydrogen at one atmosphere pressure is  $-252.8^\circ\text{C}$ .

Hydrogen has tremendous potential of becoming a critical vector in low-carbon energy transitions [1]. Solar-driven hydrogen production has been attracting upsurging attention due to its low-carbon nature for a sustainable energy future and tremendous potential for both large-scale solar energy storage and versatile applications [2], [3], [4]. Solar photovoltaic-driven ...

This makes it more difficult and expensive to store and transport hydrogen for use as a fuel (Rivard et al. 2019). There are several storage methods that can be used to address this challenge, such as compressed gas storage, liquid hydrogen storage, and solid-state storage.
