Imaginative design can help find unused spaces for extra storage on board a newbuild ship, but opportunities are more limited on existing vessels. Where retrofitting a dual fuel engine to run on methanol is feasible, the fuel storage issue may restrict a ship to short voyages or demand more frequent bunkering - both of which impact on ROI.

Methanol compared to methane also provides a higher volu-metric energy density, lower transportation costs, and does not require compression and decompression [1]. The use of methanol as a fuel and energy source constitutes a third of the world's total methanol consumption [18]. The de-mand for methanol is expected to increase as the world shifts

Methanol has a storage capacity of 12.1 wt% and an energy density of 3.3 kWh/L, this reduces to 10 wt% and 2.7 kWh/L including the solvents needed for dehydrogenation [1]. The methanol synthesis reaction can yield CO or methanol, with the former undesired given the toxicity of the compound [3].

Methanol is a promising liquid energy carrier [1] due to its relatively high volumetric and gravimetric energy density and simple handling, but it has a significantly lower roundtrip efficiency when compared with other energy storage technologies, e.g., batteries [2].Nevertheless, even when it is not converted back to electricity, methanol plays a big role as ...
