Supercapacitors, which can charge/discharge at a much faster rate and at a greater frequency than lithium-ion batteries are now used to augment current battery storage for quick energy inputs and output. Graphene battery technology--or graphene-based supercapacitors--may be an alternative to lithium batteries in some applications.

However, the battery can still be useful for other energy storage purposes, such as, for example, the inclusion of storage systems in the charging infrastructure for electric vehicles, which help to sustain the grid. The three main benefits that can be generated to the smart grid by reusing batteries after their first life are as follows:

For this blog, we focus entirely on lithium-ion (Li-ion) based batteries, the most widely deployed type of batteries used in stationary energy storage applications today. The International Energy Agency (IEA) reported that lithium-ion batteries accounted for more than 90% of the global investment in battery energy storage in 2020 and 2021.

Battery energy storage system (BESS) has become very widespread in the last decade. Although lithium-based batteries are preferred in many applications such as portable devices and electric vehicles, lead-acid batteries and Ni-Cd batteries are still preferred in several applications in industry such as power plants, uninterruptable power supplies, SCADA ...
