At the center of attention in the battery world, lithium is a mighty metal spurring the global battery revolution. It is ideal for batteries in many ways because it is very light (made of merely 3 protons, 3 neutrons, and 4 electrons) and highly reactive, capable of storing lots of energy between its bonds.

A battery energy storage system (BESS) captures energy from renewable and non-renewable sources and stores it in rechargeable batteries (storage devices) for later use. A battery is a Direct Current (DC) device and when needed, the electrochemical energy is discharged from the battery to meet electrical demand to reduce any imbalance between ...
