(Source: US Department of Energy) · Compressed hydrogen is the most commonly used mechanical storage method due to well-known costs and technology. However, it is not the most efficient method due to: Low volumetric density; 870 Wh/l for under 350 bar; 1,400 Wh/l for under 700 bar

In the former case, the hydrogen is stored by altering its physical state, namely increasing the pressure (compressed gaseous hydrogen storage, CGH 2) or decreasing the temperature below its evaporation temperature (liquid hydrogen storage, LH 2) or using both methods (cryo-compressed hydrogen storage, CcH 2). In the case of material-based ...
