1 Introduction. Among all options for high energy store/restore purpose, flywheel energy storage system (FESS) has been considered again in recent years due to their impressive characteristics which are long cyclic endurance, high power density, low capital costs for short time energy storage (from seconds up to few minutes) and long lifespan [1, 2].

Flywheel energy storage is a promising technology for replacing conventional lead acid batteries as energy storage systems. Most modern high-speed flywheel energy storage systems (FESS) consist of a huge rotating cylinder supported on a stator (the stationary part of a rotary system) by magnetically levitated bearings.

These hierarchically superordinate components or influencing parameters can form their own system and are often summarized and considered a ...

Indeed, the development of high strength, low-density carbon fiber composites (CFCs) in the 1970s generated renewed interest in flywheel energy storage. Based on design strengths typically used in commercial flywheels,  $\sigma_{max} / \rho$  is around 600 kNm/kg for CFC, whereas for wrought flywheel steels, it is around 75 kNm/kg.

The speed of the flywheel undergoes the state of charge, increasing during the energy storage stored and decreasing when discharges.
