Fig.3 TES ice storage tank cut-away view . A mixture of 20-30% ethylene glycol and water is commonly used in TES chilled water systems to reduce the freezing point of the circulating chilled water and allow for ice production in the storage tank. For Hot Water Thermal Energy Storage, Caldwell not only offers the ability to use traditional tank storage, but also the opportunity to gain a pressurized solution. Because we build these tanks using an ASME Pressure Vessel, we can store Hot Water at elevated pressures and temperatures, thereby reducing the total storage capacity.

Chilled Water Storage System Tank Size Requirements. Chilled water storage tanks require a large footprint to store the large volume of water required for these systems. Approximately 15 ft³/ton-hour is required for a 15F (8.3C) temperature difference. The greater the delta-t of the water, the smaller the tank can be.

By contrast, in a thermal storage system, domestic hot water (DHW) is provided via a heat exchanger. Cold water from the mains enters the coil at the top of the tank and is heated by the surrounding hot water before outputting to the taps. Hot water is therefore effectively provided on demand and at mains pressure.
