Capacitors used for energy storage. Capacitors are devices which store electrical energy in the form of electrical charge accumulated on their plates. When a capacitor is connected to a power source, it accumulates energy which can be released when the capacitor is disconnected from the charging source, and in this respect they are similar to batteries.

energy for fast pulses. These advances in energy density were driven by military research in directed energy weapons and kinetic energy weapons, such as railguns. The major driver for the development of large energy storage capacitors in the mid- to late-1990's was the National Ignition Facility (NIF), a U.S. Department
