every degree lower requires 2-3% more energy. There is therefore an important question to be investigated: is -18°C relevant in the context of today's food products, and does reducing refrigeration temperatures to below those that are required to maintain product safety and quality lead to unnecessary energy consumption with associated avoidable

Power Edison, the leading developer and provider of utility-scale mobile energy storage solutions, has been contracted by a major U.S. utility to deliver the system this year. At more than three megawatts (3MW) and twelve megawatt-hours (12MWh) of capacity, it will be the world's largest mobile battery energy storage system.

To address these problems, mobile energy storage system (MESS) fleets can be used to provide flexible emergency power supply economically for network restoration services. MESSs can also hedge against load and DG output forecast risks. The MESS is a utility-scale storage bank (e.g., lithium-ion batteries) that is fully controlled by the utility.

Haha, I've been through at least 30 linkedin pages and found those three degrees to be the top few, with Material Engineering as one of the most common. I'm not super keen on electrical engineering though, as I'd rather focus on the chemistry of the batteries rather than energy generation (solar panels, wind turbines and all that). Thanks again!
