With the frequent occurrence of extreme weather, the resilience of distribution system (DS) has become a hot research topic in recent years. In this article, a novel resilience improvement approach is proposed, the multi-stage restoration process is taken into account to enhance the resilience of DS, and the active islanding and separable mobile energy storage ...

In addition to microgrid support, mobile energy storage can be used to transport energy from an available energy resource to the outage area if the outage is not widespread. A MESS can move outside the affected area, charge, and then travel back to deliver energy to a microgrid.

The ongoing global energy transition towards renewable power generation has led to major concerns regarding power system flexibility, which is defined as the ability of a power system to respond to a large range of uncertainty and variability from RES [3] comparison to traditional reserve service focusing on capacity and constant ramping requirement, power ...

To address regional blackouts in distribution networks caused by extreme accidents, a collaborative optimization configuration method with both a Mobile Energy Storage System (MESS) and a Stationary Energy Storage System (SESS), which can provide emergency power support in areas of power loss, is proposed. First, a time-space model of MESS with a ...

Improving power grid resilience can help mitigate the damages caused by these events. Mobile energy storage systems, classified as truck-mounted or towable battery storage systems, have recently been considered to enhance distribution grid resilience by providing localized support to critical loads during an outage.
