Pumped hydro storage (PHS) is a form of energy storage that uses potential energy, in this case water. It is an elderly system; however, it is still widely used nowadays, ...

as low-pressure tanks in closed hydraulic circuits (Kan et al., 2015; Costa and Sephiri, 2019), shock absorbers (Porumamilla et al., 2008), and as part of switched hydraulic circuits,

Rectangular reservoirs are a common type which traditionally have a hydraulic power unit comprised of a pump, electric motor, and other components mounted on top of the hydraulic reservoir tank. Therefore, the top of the reservoir must be structurally rigid enough to support these components, maintain alignments, and minimize vibration.

1. UNDERSTANDING ENERGY STORAGE TANKS. Energy storage tanks serve a critical role in hydraulic stations by accommodating fluctuations in demand and enhancing system stability. They function as buffers, storing excess hydraulic fluid during periods of low usage and releasing it when demand surges.

Such complexes are called "pumped storage plants". In the area of energy storage, they are definitely the record-keepers. Energy can be stored in other ways, in electric batteries, or thermally in huge reservoirs of molten salts or as compressed air, (the Chapter 11 in this text is devoted specifically to energy storage methods).

The potential energy of compressed air represents a multi-application source of power. Historically employed to drive certain manufacturing or transportation systems, it became a source of vehicle propulsion in the late 19th century. During the second half of the 20th century, significant efforts were directed towards harnessing pressurized air for the storage of electrical ...
