Flywheel energy storage systems have gained increased popularity as a method of environmentally friendly energy storage. Fly wheels store energy in mechanical rotational energy to be then converted into the required power form when required.

Flywheel energy storage systems (FESSs) have proven to be feasible for stationary applications with short duration, i.e., voltage leveling, frequency regulation, and uninterruptible power supply, because they have a long lifespan, are highly efficient, and have high power density .

However, the high cost of purchase and maintenance of solar batteries has been a major hindrance. Flywheel energy storage systems are suitable and economical when frequent charge and discharge cycles are required. Furthermore, flywheel batteries have high power density and a low environmental footprint.
