

Due to excellent optical properties and superior electrochemical performance in terms of CV, cycling stability and low charge-transfer resistance, the CQDs presented in this study can be potentially utilized for the photocatalytic applications as well as energy storage applications such as fabrication of high-performance supercapacitors.

The activation energy, energy density and the conduction mechanism in the studied materials were studied. The improvements in the optical features and dielectric properties and conductivity make chromia/PVA/Na-CMC suitable for more advanced applications that require flexible nanocomposites for photonic devices and energy storage applications.

Considering the attractive strategies of enlarging storage capacity, in this review, we outline three categories of materials including UCNPs, GDs, and DTDs for elaborately ...

During the past decades, rechargeable sodium-ion batteries (SIBs) have attracted huge research interest as an economical source for energy storage applications in clean energy, electric vehicles ...

In this section, several applications of metal halide perovskites, including photovoltaics, light emission and solar energy storage, are discussed, with the motivation to stimulate potential new ...

These optimized electrical, optical, and electrochemical performances of post-treated PEDOT-PSS films spin coated onto PET substrate presents an important advancement towards fabrication of low-cost, high performance flexible electrodes for optoelectronic and energy storage applications. CRediT authorship contribution statement

Reducing building energy consumption, improving aesthetics, and improving occupant privacy as well as comfort by dynamically adjusting solar radiation are important application areas for electrochromic (EC) smart windows. However, the current transition metal oxides still cannot meet the requirements of neutral coloration and large optical modulation. We ...

In addition, potential applications in optical information storage are shown macroscopically in a thermally stimulated demonstration experiment. Binary information readout is achieved in the two-dimensional plane by simulating a CD-ROM experiment, which provides a promising future in the potential application of optical information storage.

Optical products were once thought to represent the future of data storage, but their evolution has been slower than many industry experts had first anticipated. This article describes the latest progress in optical data storage applications and explains how these products will need to adapt to compete with other technologies over the next 10 years. It is based on the findings of the ...

In the present paper, we report the influence of phase segregation (hexagonal and monoclinic phase) of facile microwave-assisted BPO (BiPO₄) nanostructures on optical and electrochemical properties for supercapacitor applications. The XRD patterns reveal pure phase formation of both the samples of BiPO₄ synthesized at 300 °C and 600 °C (JCPDS #15-0766 ...

This volume describes recent advancements in the synthesis and applications of nanomaterials for energy harvesting and storage, and optoelectronics technology for next-generation devices.

Optical properties indicate significant absorption and optical conductivity in the energy spectrum of 6-9 eV. NaZnH₃ has a greater static refractive index and reflectivity as compared to KZnH₃. The research on hydrogen storage suggests that both of these materials can store hydrogen, however, NaZnH₃ is a more promising candidate due to its ...

Particularly, the researchers engaged in optical data storage have also carried on remarkable investigations on the other functional materials such as quantum dots (QDs) [83, 84, 85, 86], glass-based media [87, 88], azobenzene derivatives [89, 90], and organic dyes [91, 92].

Another application of magneto-optical energy storage is in space exploration. Space exploration involves sending spacecraft and satellites into space for various purposes. The data collected by these spacecraft and satellites needs to be stored for analysis and reference purposes. Magneto-optical energy storage is ideal for this application ...

The solar energy is regarded to be the unique avenue in the future for energy conversion and storage systems [1,2]. The question is how to collect, convert, store and transport the solar energy for many applications [3]. Storage energy is indisputably one of the most challengeable issue for sustainable modern world [4,5].

In order to fulfill consumer demand, energy storage may provide flexible electricity generation and delivery. By 2030, the amount of energy storage needed will quadruple what it is today, necessitating the use of very specialized equipment and systems. Energy storage is a technology that stores energy for use in power generation, heating, and cooling ...

Electrodeposited Mo-doped WO₃ film with large optical modulation and high areal capacitance toward electrochromic energy-storage applications. Author links open overlay panel Sijie Xie a b, Zhijie Bi a b c, Yongbo Chen a b, Xiaoli He a b ... and mixed electronic/ionic conduction, which give rise to applications in the field of optical displays ...

Nonlinear optical (NLO) materials have garnered attention for their potential applications in supercapacitors, contributing to advancements in energy storage technologies. By exploiting the unique properties of NLO materials, such as high surface area, electrical conductivity, and charge storage capacity, researchers aim to enhance the ...

AlSulami, F. M. H. et al. Structural, optical, dielectric and electrical properties of flexible nanocomposite based on NaAlg/PEO composite and AgNO₃ NPs for energy storage applications and ...

Optical diffuse reflectance measurements provided insights into energy gap values, refractive index, and dielectric constant. Li⁺ doping enhanced the electrical properties ...

The optical data storage technique is one of the most significant topics of the optical applications, which is considered as the prominent solution for conquering the challenge of the explosive increase in mass data, to achieve the ...

The new 3D porous phosphorus carbide is constructed by assembling the monolayers of Imidazole graphyne using acetylenic linkers [18], where each nitrogen (N) atoms at nodes are exchanged with phosphorus (P) atom for connecting two layers in the c-direction. The primitive cell of the resulting 3D porous PC 6 is composed of four similar pentagonal rings and ...

Polymer composites (PCs) are increasingly utilized in energy storage applications, notably in dielectric capacitors, due to their distinct properties and advantages ...

Various methods have been demonstrated that use MNPs in optical data storage applications. ... the energy required for information storage and far-field super-resolution microscopy based on MNPs ...

In a nowadays world, access energy is considered a necessity for the society along with food and water [1], [2]. Generally speaking, the evolution of human race goes hand-to-hand with the evolution of energy storage and its utilization [3]. Currently, approx. eight billion people are living on the Earth and this number is expected to double by the year 2050 [4].

This work is an attempt to leverage the physicochemical properties of nano-sized Cr₂O₃ (chromia) to fabricate flexible nanocomposites, using the polyvinyl alcohol/carboxymethyl cellulose (PVA/Na-CMC) blend, for advanced applications related to the energy storage and photonic devices. Chromia nanoparticles (NP) were prepared by a simple ...

Optical storage is the technology that is based on the interaction between laser and recording medium, and the investigation on breaking the diffraction limit for conquering the challenge of present data storage has attracted extensive attention in information technology industry .

The optical data storage technique is one of the most significant topics of the optical applications, which is considered as the prominent solution for conquering the challenge of the explosive increase in mass data, to achieve the long-life, low-energy, and super high-capacity data storage.

This review provides a comprehensive overview of the progress in light-material interactions (LMIs), focusing on lasers and flash lights for energy conversion and storage applications. We discuss intricate LMI parameters

such as light sources, interaction time, and fluence to elucidate their importance in material processing. In addition, this study covers ...

1. Introduction The unavailable long-life, low-energy, super high-capacity, and renewable and sustainable optical data storage remains a severe challenge to be conquered, which promotes researchers to spare no efforts in designing and fabricating novel systems using more remarkable optical storage materials [1, 2, 3, 4, 5].

We hope that this review will be helpful for researchers to stimulate new thinking for designing novel platforms, to expand the optical storage capacity, open an avenue for synthesizing valuable materials in practical use, and understand the future development of the research field of optical storage. Scheme 1.

The newly developed ceramic, (1-x) KNN-xBSZ, exhibited remarkable performance characteristics, including an energy storage density of 4.13 J/cm³, a recoverable energy storage density of 2.95 J/cm³ at a low electric field of 245 kV/cm, and an energy storage efficiency of 84 %. Additionally, at 700 nm, the 0.875KNN-0.125BSZ sample displayed a ...

This article describes the latest progress in optical data storage applications and explains how these products will need to adapt to compete with other technologies over the next 10 years. It ...
