The energy the solar PV systems provide do not pass through an electricity meter before it is used by the home or business, but, when the panels are not in use (when there is no sunlight), energy from the grid is sent to the home or business, and that energy must pass through a meter first so that it can be accounted for by the utility.

These are installed at generation plants or at utility distribution substations. Behind-the-meter storage is installed at the consumer level. A behind-the-meter installation could be a battery wired into an individual home's electrical system, or a larger commercial building, or a neighborhood, if the installation was not owned by the utility ...
