This post describes dynamic processes and tells about energy storage components in the circuit. Here we will consider time responses of the circuit components. Components that add dynamic response to the circuit are capacitance and inductance. For example MOSFET does have internal capacitance in it's structure, that we will consider here.

What is RC Circuit? RC Circuit is a special type of circuit that has a resistor and a capacitor. These are two main components of this type of circuit and these can be connected in either series or parallel combinations. this circuit will consume energy because of the presence of a resistor in the circuit. The circuit can be driven by either a voltage source or a current source.

circuit. A circuit having a single energy storage element i.e. either a capacitor or an Inductor is called a Single order circuit and its governing equation is called a First order Differential Equation. A circuit having both Inductor and a Capacitor is called a Second order Circuit and its governing equation is called

This circuit is a little more advanced and would typically be studied in circuit analysis. Note that there are two types of analysis: mesh analysis which revolves around current loops and node analysis which revolves around the aforementioned nodes. Typically circuit analysis programs (SPICE) use the node analysis method.
