Lithium metal batteries use metallic lithium as the anode instead of lithium metal oxide, and titanium disulfide as the cathode. Due to the vulnerability to formation of dendrites at the anode, which can lead to the damage of the separator leading to internal short-circuit, the Li metal battery technology is not mature enough for large-scale manufacture (Hossain et al., 2020).

Nevertheless, usage of the Lithium-ion battery in stationary energy storage purposes is restricted due to the higher price of the battery (around \$1000/kWh). It is necessary to keep the price of the storing process less than \$200/kWh in order for renewable energy to be maintained without assistance from the government.

Tehachapi Energy Storage Project, Tehachapi, California. A battery energy storage system (BESS) or battery storage power station is a type of energy storage technology that uses a group of batteries to store electrical energy. Battery storage is the fastest responding dispatchable source of power on electric grids, and it is used to stabilise those grids, as battery storage can ...

One BESS system gaining popularity involves a bank of lithium-ion batteries with bidirectional converters that can absorb or inject active or reactive power at designated set ...

When a lithium-ion battery is damaged, it can still contain energy, and this stranded energy should be dissipated prior to interaction or removal of impacted cells. If not handled properly, the damaged batteries could cause injury, including electrical shock. This is a potential hazard for organizations dealing with Lithium-Ion Battery Energy Storage Systems (BESS).

Energy Density: A critical parameter for most designers, energy density refers to the amount of energy a battery can store for a given volume. Lithium-ion batteries boast an energy density of approximately 150-250 Wh/kg, whereas lead-acid batteries lag at 30-50 Wh/kg, nickel-cadmium at 40-60 Wh/kg, and nickel-metal-hydride at 60-120 Wh/kg.

For the time being, lithium-ion (li-ion) batteries are the favoured option. Utilities around the world have ramped up their storage capabilities using li-ion supersized batteries, huge packs which can store anywhere between 100 to 800 megawatts (MW) of energy.

Lithium-ion battery energy storage systems (BESS) are becoming more popular due to the benefits they provide to consumers, such as time-shifting, improved power quality, better network grid utilization, and

emergency power supply.

For starters, Li-ion batteries offer a greater energy density than other types of batteries, allowing manufacturers to store large amounts of energy in small places. According to industry standards, a typical lithium-ion battery can store 150 W h in a kilogram of battery. However, a lead-acid battery can only store 25 W h per kilogram of battery.

Today's EV batteries have longer lifecycles. Typical auto manufacturer battery warranties last for eight years or 100,000 miles, but are highly dependent on the type of batteries used for energy storage. Energy storage systems require a high cycle life because they are continually under operation and are constantly charged and discharged.

Several well-known battery suppliers, such as AES and Tesla, have chosen Li-ion batteries as the basis for their energy storage products, resulting in intense competition in the energy storage industry. The current work highlighted batteries' strengths, weaknesses, opportunities, and threats (SWOT) analysis in power transmission.
