Phase change material (PCM)-based thermal energy storage significantly affects emerging applications, with recent advancements in enhancing heat capacity and cooling power. This perspective by Yang et al. discusses PCM thermal energy storage progress, outlines research challenges and new opportunities, and proposes a roadmap for the research community from ...

Energy security and environmental concerns are driving a lot of research projects to improve energy efficiency, make the energy infrastructure less stressed, and cut carbon dioxide (CO₂) emissions. One research goal is to increase the effectiveness of building heating applications using cutting-edge technologies like solar collectors and heat pumps. ...

The aim of this research is to enhance the performance of Glauber's salt (sodium sulfate decahydrate, SSD) as a phase change material (PCM) for thermal energy storage applications, as well as for shipping of temperature-sensitive materials. The study investigates the effects of modifying SSD with potassium chloride (KCl) and ammonium chloride (NH₄Cl) to ...

Therefore, serious actions have to be taken to limit this consumption by implementing various renewable technologies and systems. Amongst booming technologies, incorporating phase change material (PCM) is a fast-growing technology in the building industry that has been implemented to improve thermal performance and energy-saving [3], [4], [5], [6].

Solar thermal energy can be effectively stored in walls of a building by incorporating Phase Change Materials (PCMs) within them. Plasterboards containing PCM can be used to absorb and store solar ...

Thermal energy storage technologies utilizing phase change materials (PCMs) that melt in the intermediate temperature range, between 100 and 220 °C, have the potential to mitigate the intermittency issues of wind and solar energy. This technology can take thermal or electrical energy from renewable sources and store it in the form of heat. This is of particular ...

Therefore, phase change materials (PCMs), which can store or release energy as a form of latent heat within a certain temperature, has attracted tremendous attention [1-3]. As an emerged ...

Phase change materials (PCMs) are ideal carriers for clean energy conversion and storage due to their high thermal energy storage capacity and low cost. During the phase transition process, PCMs are able to store thermal energy in the form of latent heat, which is more efficient and steadier compared to other types of heat storage media (e.g ...

Photothermal phase change energy storage materials (PTPCESMs), as a special type of PCM, can store energy and respond to changes in illumination, enhancing the efficiency of energy systems and ...

Phase change materials (PCMs) provide passive storage of thermal energy in buildings to flatten heating and cooling load profiles and minimize peak energy demands. They are commonly microencapsulated in a protective shell to enhance thermal transfer due to their much larger surface-area-to-volume ratio.

Phase change materials (PCMs) are extensively used now a days in energy storage devices and applications worldwide. PCMs play a substantial role in energy storage for solar thermal applications and renewable energy sources integration. High thermal storage density with a moderate temperature variation can be attained by phase change materials ...

used as thermal energy storage material have been published. The materials needed for phase-change thermal energy storage must have a large latent heat and high thermal conductivity. They should ...

To meet the demands of the global energy transition, photothermal phase change energy storage materials have emerged as an innovative solution. These materials, utilizing various photothermal conversion carriers, can passively store energy and respond to changes in light exposure, thereby enhancing the efficiency of energy systems.

1 Introduction. Building energy consumption is maximising year after year due to population, urbanisation, and people's lifestyle. The increased greenhouse gas (GHG) emissions and climate change risks have drawn attention to adopting alternative energy sources [1, 2]. Buildings are globally known as the biggest consumer of energy and the main ...

Energy storage with PCMs is a kind of energy storage method with high energy density, which is easy to use for constructing energy storage and release cycles [6] applying cold energy to refrigerated trucks by using PCM

has the advantages of environmental protection and low cost [7]. The refrigeration unit can be started during the peak period of renewable ...

The PCMs belong to a series of functional materials that can store and release heat with/without any temperature variation [5, 6]. The research, design, and development (RD& D) for phase change materials have attracted great interest for both heating and cooling applications due to their considerable environmental-friendly nature and capability of storing a large amount ...

The numerical solution of the phase change problem having a constant heat flux boundary ($q = \text{constant}$) as a function of time when the boundary superheat reaches $T_w - T_m = 10 \text{ K}$ forms the upper limit of the shaded bands.

Because of the limited supply of fossil fuels, Phase change materials have drawn the interest of a wide range of researcher scholars, organizations and suppliers over the past few years as thermal energy storage and releasing it when needed [1], [2], [3]. In building division, private and commercial as well as residential buildings, over one ...

3 · Thermal energy storage systems using PCM offer promising solutions for efficient thermal applications. ... Comparative Analysis of Heat Exchanger Models for Phase Change Material Melting Process: Experimental and Numerical Investigation ... University of Baghdad, ...

The materials used for latent heat thermal energy storage (LHTES) are called Phase Change Materials (PCMs) [19]. PCMs are a group of materials that have an intrinsic capability of absorbing and releasing heat during phase transition cycles, which results in the charging and discharging [20].

Applied and Computational Mechanics, 2020. The problems of heat and mass transfer in phase change materials are of great engineering interest. The absorption and storage of energy in the form of latent heat makes it possible to ...

Materials that change phase (e.g., via melting) can store thermal energy with energy densities comparable to batteries. Phase change materials will play an increasing role in reduction of greenhouse gas emissions, by scavenging thermal energy for later use. Therefore, it is useful to have summaries of phase change properties over a wide range of materials. In the ...

SUMMARY. Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy stor-age applications. However, the relatively low ...

Phase Change Materials for Energy Storage Devices. Thermal storage based on sensible heat works on the temperature rise on absorbing energy or heat, as shown in the solid and liquid phases in Figure (PageIndex{1}). When the stored heat is released, the temperature falls, providing two points of different
