The electrochemical energy storage/conversion devices mainly include three categories: batteries, fuel cells and supercapacitors. Among these energy storage systems, supercapacitors have received great attentions in recent years because of many merits such as strong cycle stability and high power density than fuel cells and batteries [6,7].

From the plot in Figure 1, it can be seen that supercapacitor technology can evidently bridge the gap between batteries and capacitors in terms of both power and energy densities. Furthermore, supercapacitors have longer cycle life than batteries because the chemical phase changes in the electrodes of a supercapacitor are much less than that in a battery during continuous ...

In recent years, supercapacitors have been used as energy storage devices in renewable and hybrid energy storage systems to regulate the source and the grid. Voltage stability is achieved through the use of these devices. A supercapacitor can help keep the power supply stable when the load constantly shifts.

MIT engineers have created a "supercapacitor" made of ancient, abundant materials, that can store large amounts of energy. Made of just cement, water, and carbon black (which resembles powdered charcoal), the device could form the basis for inexpensive systems that store intermittently renewable energy, such as solar or wind energy.
