The energy storage system is an important part of peak shaving and valley filling in the power grid. In order to increase the reliability of the ship energy storage system and reduce the cost input, the intelligent control and cost research of the energy storage system is very important. An intelligent control strategy is proposed in this paper.

To capture the unit cost associated with energy storage, we introduce the Levelized Cost of Energy Storage (LCOES) which, like the commonly known Levelized Cost of Energy, is measured in monetary units (say U.S. \$) per kWh.

The microgrid consists of 1.7 megawatts (MW) of rooftop and carport PV solar cells, 1.6 MWh of BESS in a 20-foot-long unit, diesel generators, integration with building management, and onsite energy management with Honeywell's Experion Energy Control System and Forge Sustainability+ Power Manager software.

Pumped storage hydro (PSH) is a mature technology that includes pumping water from a lower reservoir to a higher one where it is stored until needed. When released, the water from the upper reservoir flows back down through a turbine and generates electricity.

This article proposes a novel energy control strategy for distributed energy storage system (DESS) to solve the problems of slow state of charge (SOC) equalization and slow current sharing. In this strategy, a key part of the presented strategy is the integration of a new parameter virtual current defined from SOC and output current.
