A Liquid Cold Plate (LCP) is responsible for efficiently transferring heat from surfaces with high heat loads to the fluid used within a liquid cooling system. The performance of the liquid cold plate is critical in defining the overall effectiveness of a liquid system. Reliable, 100% leak tested cold plates produced for decades.

In 2021, a company located in Moss Landing, Monterey County, California, experienced an overheating issue with their 300 MW/1,200 MWh energy storage system on September 4th, which remains offline.

The liquid cooling plate adopts liquid cooling to achieve high heat dissipation efficiency. This efficiency is better than air cooling. It is a high-performance electric thermal management system.

It is a cooling method that is superior to air cooling. The heat is transferred from the cell to the two-phase coolant. This, combined with the internal channel circulation of the cold plate, achieves localized heat dissipation from the cell. It also achieves optimum charge and discharge performance and extending battery life.
