While many papers compare different ESS technologies, only a few research, studies design and control flywheel-based hybrid energy storage systems. Recently, Zhang et al. present a hybrid energy storage system based on compressed air energy storage and FESS.

The speed of the flywheel undergoes the state of charge, increasing during the energy storage stored and decreasing when discharges. A motor or generator (M/G) unit plays a crucial role in facilitating the conversion of energy between mechanical and electrical forms, thereby driving the rotation of the flywheel [74]. The coaxial connection of both the M/G and the flywheel signifies ...

This can be achieved by high power-density storage, such as a high-speed Flywheel Energy Storage System (FESS). It is shown that a variable-mass flywheel can effectively utilise the FESS useable capacity in most transients close to optimal. Novel variable capacities FESS is proposed by introducing Dual-Inertia FESS (DIFESS) for EVs.

The concept of flywheel energy storage goes back a long way. In Antiquity, potter's wheels worked using a wooden disc, which regulated and facilitated the spinning movement the craftsman produced with his foot. The same technique was used in many 19<sup>th</sup> century steam engines. In the 1920s, some Belgian and Swiss streetcars ran between stations ...
