What is photovoltaic (PV) technology and how does it work? PV materials and devices convert sunlight into electrical energy. A single PV device is known as a cell. An individual PV cell is usually small, typically producing about 1 or 2 watts of power. These cells are made of different semiconductor materials and are often less than the thickness of four human hairs.

The results show that the PV energy storage system has good power tracking ability, can realize flexible on-grid and off-grid switching. At the same time, the system can provide inertia and damping, and simulate the primary frequency regulation and primary voltage regulation characteristics of synchronous generators to improve system stability.
