Since the publication of the first Energy Storage Safety Strategic Plan in 2014, there have been introductions of new technologies, new use cases, and new codes, standards, regulations, and testing methods. Additionally, failures in deployed energy storage systems (ESS) have led to new emergency response best practices.

energy storage. The study included PV stability and integration issues along with the electrical energy storage systems types and cost trends. Hoda et al<sup>16</sup> studied different energy storage that can be efficiently integrated with PV systems. The selection of the most appropriate energy storage also depends upon the intended end use.

Energy Storage Systems and how safety is incorporated into their design, manufacture and operation. It is intended for use by policymakers, local communities, planning authorities, first responders and battery storage project developers.

A framework is provided for evaluating issues in emerging electrochemical energy storage technologies. The report concludes with the identification of priorities for advancement of the three pillars of energy storage safety: 1) science-based safety validation, 2) incident preparedness and response, 3) codes and standards.

The key to addressing the risk of incidents in BESS lies in the development of accurate safety assessment methods. Xiao et al. [23] proposed a risk assessment framework for the operation of LIB energy storage stations based on the AHP and TOPSIS methods, focusing on scoring the risk levels of existing energy storage stations.

The International Renewable Energy Agency predicts that with current national policies, targets and energy plans, global renewable energy shares are expected to reach 36% and 3400 GWh of stationary energy storage by 2050. However, IRENA Energy Transformation Scenario forecasts that these targets should be at 61% and 9000 GWh to achieve net zero ...
