Shearing is a fundamental manufacturing process within sheet metal fabrication, serving as a primary method for cutting and shaping flat metal sheets. This process involves the use of shearing machines equipped with sharp blades, where the upper blade descends against the lower blade to cut through the sheet material.

The hydraulic shearing machine is a hydraulic driven shearing machine uses the blade of the movement and the fixed lower blade, and uses the reasonable blade clearance to apply the shear force to the metal plate of various thickness, so that the plate is broken and separated according to the required size.
