The International Energy Agency (IEA) reported that by 2035 global CO₂ emissions will exceed 37.0 gigatons. The CO₂ emissions are produced in multiple economic areas such as output from transportations, industry, buildings, electricity, heat production, and agriculture. The CO₂ emission from the production sector, such as electricity and heat ...

The increase of vehicles on roads has caused two major problems, namely, traffic jams and carbon dioxide (CO₂) emissions. Generally, a conventional vehicle dissipates heat during consumption of approximately 85% of total fuel energy [2], [3] in terms of CO₂, carbon monoxide, nitrogen oxide, hydrocarbon, water, and other greenhouse gases (GHGs); 83.7% of ...

Distributed energy resources (DERs) produce and supply electricity on a small scale and are spread out over a wide area. Supporting these technologies are codes and standards to ensure their safe installation and operation. Rooftop solar electric systems and battery energy storage systems are examples of DERs.

However, this technology, a kind of chemical ESSs, is developing and immature, with a very low round-trip efficiency (~20-50 %). The supercapacitor and superconducting magnetic energy storage (SMES) technologies are proper for short-time, and large load smoothing, improving the power quality of networks on a small energy storage scale.

Photovoltaic cells produce electric energy in a short interval during a period of low demand and show high levels of intermittency. One of the well-known solutions is to store the energy and convert it into a more stable form, to transform again into electricity during periods of high demand, in which the energy has a higher value. This process provides economic viability ...
