Turbine blades for small-scale wind turbines are typically 1.5 to 3.5 metres (4 ft 11 in - 11 ft 6 in) in diameter and produce 0.5-10 kW at their optimal wind speed. [1] Most small wind turbines are horizontal-axis wind turbines, [2] but vertical axis wind turbines (VAWTs) may have benefits in maintenance and placement, although they are less efficient at converting wind to electricity. [3]

This segment explores how battery storage is integrated with wind turbines and examines the various types of batteries that are fit for home use.
