

A need for lightweight energy storage technology is fueling the development of carbon fiber composite materials for car batteries and other electronics. ... made for the design of fiber-reinforced silos and tanks. ... prototype and production-ready smart devices featuring thermoplastic composite cases and other components provide lightweight ...

With the growing market of wearable devices for smart sensing and personalized healthcare applications, energy storage devices that ensure stable power supply and can be constructed in flexible platforms have attracted tremendous research interests. A variety of active materials and fabrication strategies of flexible energy storage devices have been ...

In this work, we report a 90  $\mu$ m-thick energy harvesting and storage system (FEHSS) consisting of high-performance organic photovoltaics and zinc-ion batteries within an ...

The progress of fiber-shaped energy storage devices includes device structure, preparation strategies, and application. The application of fiber-shaped energy storage devices ...

Given that most active materials in the battery electrodes are ceramics, the mechanical attributes of structural batteries are achieved by ceramic-matrix composite reinforcement or toughening, such as fiber strengthening, ductile-phase toughening, and transformation toughening. 39-41 This amalgamation of energy storage principles and mechanical ...

The growth of miniature and wearable electronics has promoted the development of smart and multifunctional fibers. Particularly, the incorporation of functional semiconductors and electroactive materials in fibers has opened up the field of fiber electronics. The energy supply system is the key branch for fiber electronics.

With the rapid advancements in flexible wearable electronics, there is increasing interest in integrated electronic fabric innovations in both academia and industry. However, currently developed plastic board-based batteries remain too rigid and bulky to comfortably accommodate soft wearing surfaces. The integration of fabrics with energy-storage devices ...

Carbon-based fibrous supercapacitors (CFSs) have demonstrated great potential as next-generation wearable energy storage devices owing to their credibility, resilience, and high power output. The limited specific surface area and low electrical conductivity of the carbon fiber electrode, however, impede its practical application. To overcome this challenge, ...

A novel, all-solid-state, flexible "energy fiber" that integrated the functions of photovoltaic conversion and energy storage has been made based on titania nanotube ...

[12, 13] Compared to the conventional energy storage materials (such as carbon-based materials, conducting

polymers, metal oxides, MXene, etc.), nanocellulose is commonly integrated with other electrochemically active materials or pyrolyzed to carbon to develop composites as energy storage materials because of its intrinsic insulation ...

In recent years, with the rapid advancement in various high-tech technologies, efficient heat dissipation has become a key issue restricting the further development of high-power-density electronic devices and components. Concurrently, the demand for thermal comfort has increased; making effective personal thermal management a current research hotspot. ...

The smart design of electrodes reviewed in this article will inspire reasonable ideas for interdisciplinary researchers working in the fields of miniaturized device design for energy harvest, conversion, and storage as well as in the fields of material sciences, nanotechnology, and microelectronic device integration.

A systematic review of the current state of the art with respect to the design and fabrication of electronic fiber materials, construction of fiber-based devices, and integration of smart systems is presented. Fiber is a symbol of human civilization, being ubiquitous but obscure in society over most of history. Fiber has been revived upon the advent of fiber-based ...

On the basis of considering the chemical reversibility and stability, the functional design of electrode material also plays an important role in achieving the smart battery system. And this issue would determine the application of smart energy storage devices in wearable electronic devices or other intelligent fields in future.

However, the production of flexible and efficient smart energy storage fiber is still challenging. Here, flexible electro-/photo-driven energy storage polymer fiber with outstanding hydrophobicity and self-cleaning property is fabricated. ... As a result, considerable efforts have been made to design and fabricate form-stable PCM composites ...

Applications of fiber optic sensors to battery monitoring have been increasing due to the growing need of enhanced battery management systems with accurate state estimations. The goal of this review is to discuss the advancements enabling the practical implementation of battery internal parameter measurements including local temperature, strain, ...

This paper initially starts to introduce the development of functional fibers in energy conversion and storage, with an emphasis on supercapacitors, solar cells, and nanogenerator batteries. ...

**2.2 Scalable Production of Graphene/MoS<sub>2</sub> Heterostructure on Glass Fiber Fabrics.** Here, we report a highly scalable method [48, 49] for the LBL deposition of graphene/MoS<sub>2</sub> heterostructures onto glass fiber fabric. To the best of our knowledge, this is the first time such a technique has been applied to the manufacturing of next-generation smart ...

Therefore, the integration of energy storage capability into CFRP composites holds great promise for reducing

the weight and volume of the overall system, as such composites distribute the energy load that would otherwise be carried solely by energy storage devices, while acting as load-bearing structural components [36], [37], [38].

The smart energy storage fiber with integrative properties could be woven into fabrics, providing a new option for smart textiles in wearable and protective systems. Discover the world's research ...

Continuously charging an energy storage system (ESS) without the consumption of fossil fuels has always been an attractive proposition towards a sustainable low-carbon society [1, 2]. This is especially desirable with the tremendous adoption of portable devices such as wearable electronics in recent years, where energy consumption has been rapidly on the rise ...

4.1.1 Mechanical reliability of yarn/fiber-shaped energy storage devices. Due to the excellent flexibility and ductility of 1D structures (such as carbon fiber, metal fiber, polymer fiber), when it is used as an active material loading or directly ...

Smart wearables equipped with integrated flexible actuators possess the ability to autonomously respond and adapt to changes in the environment. Fibrous textiles have been recognised as promising platforms for integrating flexible actuators and wearables owing to their superior body compliance, lightweight nature, and programmable architectures. Various ...

Currently, flexibly wearable electronics greatly facilitate our life that can collect non-electrical signals such as physiological signals or body motions and then translate them into electrical signals such as current, voltage or resistance. With the development of next-generation wearable devices, functional and intelligent textile with softness, wearability and durability has ...

Smart textiles have emerged as potential part for wearable devices and protective systems. Integrating phase change materials (PCMs) into stimuli-responsive fibers offers exciting opportunities for smart clothing to realize instant energy conversion/storage and temperature regulation. However, the production of flexible and efficient smart energy storage fiber is still ...

Research on fiber supercapacitors (FSs) has gained traction in the realm of wearable electronics owing to their potential as efficient energy storage solutions in various domains, including healthcare, environmental monitoring, and military applications [1,2,3,4,5,6,7,8,9,10]. Unlike conventional rigid and bulky cell or film-type supercapacitors, FSs ...

DOI: 10.1039/d0cs01603a Corpus ID: 233448345; Smart fibers for energy conversion and storage. @article{Ma2021SmartFF, title={Smart fibers for energy conversion and storage.}, author={Wujun Ma and Yang Zhang and Shaowu Pan and Yanhua Cheng and Ziyu Shao and Hengxue Xiang and Guoyin Chen and Li-ping Zhu and Wei-Peng Weng and Hao Bai and ...

Indeed, the highest values of energy storage obtained in this study for the composite containing three integrated EDLC interleaves are 174 mWh kg<sup>-1</sup> of energy density and 54 W kg<sup>-1</sup> of power ...

Fibrous energy-autonomy electronics are highly desired for wearable soft electronics, human-machine interfaces, and the Internet of Things. How to effectively integrate various functional energy fibers into them and realize versatile applications is an urgent need to be fulfilled. Here, a multifunctional coaxial energy fiber has been developed toward energy ...

Design of the FEHSS. Figure 1A, B show an illustration of the structure and the material composition of our FEHSS. The ultraflexible OPV module (chemical structure of the active materials in Fig ...

Flexible microelectronic devices have seen an increasing trend toward development of miniaturized, portable, and integrated devices as wearable electronics which have the requirement for being light weight, small in dimension, and suppleness. Traditional three-dimensional (3D) and two-dimensional (2D) electronics gadgets fail to effectively comply with ...
