These systems work by having the electric motor accelerate the rotor to high speeds, effectively converting the original electrical energy into a stored form of rotational energy (i.e., angular momentum). The flywheel continues to store energy as long as it continues to spin; in this way, flywheel energy storage systems act as mechanical energy ...

By capturing idle energy from the generator and storing it in the flywheel, the flywheel unit provides an instantaneous reactive boost of up to 80kW of real power for 7 seconds, eliminating peak starting currents experienced by the generator, with the potential to halve the size of the generator used, reducing fuel consumption and emissions.
