coil mounted close to the walls in the vapor space of the tank. There is no heating system provided for the tank roof. The steam coils provide heat to the molten sulfur to maintain the liquid sulfur above its melting point.

o Cleaning tanks: at least 10 turnovers per hour  
o Heavily soiled tanks: up to 20 turnovers per hour  
o Critical cleaning tanks: more than 20 turnovers per hour  
2. THEN CALCULATE THE NEEDED FLOW RATE  
Multiply the appropriate turnover rate by the tank volume and then divide by 60  
Example:  $10 \times 800 (3028.3) = 8,000 \text{ gph} (30,283 \text{ l/hr})$  ||
