

Advanced Energy Materials is your prime applied energy journal for research providing solutions to today's global energy challenges. Abstract The electrochemo-mechanical effects on the structural integrity of electrode materials during cycling is a non-negligible factor that affects the cyclability and rate performance of all so...

Corrigendum to "Pyridinic-to-graphitic conformational change of nitrogen in graphitic carbon nitride by lithium coordination during lithium plating" [Energy Storage Materials 31 (2020) 505-514] Yuju Jeon, Sujin Kang, Se Hun Joo, Minjae Cho, ...

An ideal rechargeable battery for stationary energy storage should have high security, long cycle life, good environmental friendliness ... C. Wang, L. Wang, J. Zhou, S. Liang. Li + intercalated  $V_2O_5 \cdot nH_2O$  with enlarged layer spacing and fast ion diffusion as an aqueous zinc-ion battery cathode. Energy Environ. Sci., 11 (2018), pp. 3157 ...

Li-ion battery (LiB) has significantly redefined the ways we communicate, transport, and reside. However, the increasing demand for high-energy density storage devices in the ever-growing 5G era presents great challenges that now LiBs can no longer address, motivating extensive research on the next-generation energy storage materials and ...

The shortage of lithium in optimally designed batteries not only leads to a depreciation of energy density but also deteriorates the electrode structure resulting in degradation of cycle life. ... the challenges and development trends aspires to provide a comprehensive prelithiated hybrid lithium replenishment and storage technology as a ...

Although Li metal anodes offer the highest possible specific energy density for Li-based battery chemistries, practical application is plagued by Li filament growth, with adverse effects on both Coulombic efficiency (CE) and battery safety. The structure and resulting properties of the solid electrolyte interphase (SEI) on Li metal are critical to controlling Li ...

With the ever-increasing adaption of large-scale energy storage systems and electric devices, the energy storage capability of batteries and supercapacitors has faced increased demand and challenges. The electrodes of these devices have experienced radical change with the introduction of nano-scale materials. As new generation materials ...

select article Polarized nucleation and efficient decomposition of  $\text{Li}_2\text{O}$ ; for  $\text{Ti}_2\text{C}$  MXene cathode catalyst under a mixed surface condition in lithium-oxygen batteries

Liquid air energy storage (LAES) uses air as both the storage medium and working fluid, and it falls into the broad category of thermo-mechanical energy storage technologies. The LAES technology offers several advantages including high energy density and scalability, cost-competitiveness and non-geographical constraints, and hence has attracted ...

@article{Liang2023EnablingSA, title={Enabling Stable and High Areal Capacity Solid State Battery with Ni-rich Cathode via Failure Mechanism Study}, author={Ziteng Liang and Yao Xiao and Kangjun Wang and Yanting Jin and Siyuan Pan and Jiangwei Zhang and Yuqi Wu and Yu Su and Haoyue Zhong and Yong Yang}, journal={Energy Storage Materials}, year ...

In addition, the energy-dispersive X-ray spectroscopy (EDX) mapping of the  $\text{SnS}_2$  @N-HPCNFs electrode indicated the uniform distribution of C, N, O, Sn, and S elements in the electrode, which illustrated that  $\text{SnS}_2$  nanosheet was completely confined into the 1D carbon nanofibers (Figure S3, Supporting Information). The crystal structure of the  $\text{SnS}_2$  @N-HPCNFs ...

Batteries and supercapacitors represent two complementary electrochemical energy storage (EES) technologies (1-4), with the batteries offering high energy density but low power density and supercapacitors providing high power density with low energy density. Although lithium (Li)-ion batteries currently dominate the market for powering consumer electronic ...

Zinc-air batteries deliver great potential as emerging energy storage systems but suffer from sluggish kinetics of the cathode oxygen redox reactions that render unsatisfactory cycling lifespan. The exploration on bifunctional electrocatalysts for oxygen reduction and evolution constitutes a key solution, where rational design strategies to ...

This paper investigates the pivotal role of Long-Duration Energy Storage (LDES) in achieving net-zero emissions, emphasizing the importance of international collaboration in ...

The Li-argyrodites,  $\text{Li}_{6-x}\text{PS}_{5-x}\text{Cl}_{1+x}$  ( $x = 0, 0.3, 0.5, 0.7, \text{ and } 0.8$ ), are prepared to investigate the correlation of anion chemistry, structure, and composition with ionic conductivity. To create more Cl<sup>-</sup> at 4d sites, beyond the limit generated by spontaneous Cl-S exchange in  $\text{Li}_6\text{PS}_5\text{Cl}$ , more Cl is inserted into the structure to replace S at the 4d sites with ...

A phenomenon is observed in which the electrochemical performances of porous graphene electrodes show unexpectedly increasing capacities in the Li storage devices. However, despite many studies, the cause is still unclear. Here, we systematically present the reason for the capacity enhancements of the pristine graphene anode under functional group ...

Jin Zhong's 103 research works with 2,974 citations and 15,409 reads, including: Prestudy H2ESIN: Hydrogen, energy system and infrastructure in Northern Scandinavia and Finland

Lamellar molybdenum disulfide (MoS<sub>2</sub>) has attracted a wide range of research interests in recent years because of its two-dimensional layered structure, ultrathin thickness, large interlayer distance, adjustable band gap, and capability to form different crystal structures. These special characteristics and high anisotropy have made MoS<sub>2</sub> widely ...

According to the study, cryogenic energy storage and liquefied gases research has evolved from foundational concepts to more advanced areas, focusing on improving energy efficiency, waste heat recovery, and system integration. Studies show significant improvements in round-trip efficiency, with some configurations achieving up to 70 % efficiencies.

The development of energy storage technology is an exciting journey that reflects the changing demands for energy and technological breakthroughs in human society. Mechanical methods, such as the utilization of elevated weights and water storage for automated power generation, were the first types of energy storage.

Tetrabutylammonium bromide (TBAB) semi-clathrate hydrate possesses a unique clathrate structure for capturing and sequestering small-molecule gases, such as CH<sub>4</sub>, H<sub>2</sub> and, CO<sub>2</sub> and the advantage of phase change energy storage. Elucidating the diversified reactions and determining the optimal phase change characteristics of TBAB hydrate is crucial ...

Articles from the Special Issue on Battery and Energy Storage Devices: From Materials to Eco-Design; Edited by Claudia D'Urso, Manuel Baumann, Alexey Kuposov and Marcel Weil; Article from the Special Issue on Electrochemical Energy storage and the NZEE conference 2020 in Czech Republic; Edited by Petr Vanysek;

Renata Orinakova and Jiri Vanek

Our findings show that energy storage capacity cost and discharge efficiency are the most important performance parameters. Charge/discharge capacity cost and charge efficiency play secondary roles. Energy capacity costs must be  $\leq \text{US\$}20 \text{ kWh}^{-1}$  to reduce electricity costs by  $\geq 10\%$ .
