As for all energy systems, this would require energy storage to alleviate the supply and demand disparity within the energy value chain. Despite a great deal of effort to reduce the cost of hydrogen generation, there has been relatively little attention paid to the cost of hydrogen storage.

The levelized cost of per kilogram H₂ storage is \$0.38/kg, which is much less than the current production cost of green hydrogen via electrolysis in China (~\$10/kg [107, 108]), indicating that the cost of UHS may only constitute a comparatively small fraction of the whole hydrogen value chain. It is worth noting that the cost of gas ...

Large-scale hydrogen storage plays a crucial role in the potential future clean hydrogen economy. Indeed, both the production of hydrogen from processes with a low or zero carbon footprint [1,2,3,4,5] and the research of cost-effective and high-capacity storage methods are at the core of developing the hydrogen economy. This could aid climate goals because ...
