In addition, due to the reduced system load, the charging power of the energy storage post-response is lower compared to pre-response. In periods 19 to 24, where new energy output is limited, the reduction in output from traditional units is less compared to other periods, and to meet the system load demand, energy storage begins to discharge.

Energy is a fundamental requirement to perform almost all human activities, making it an integral part of day-to-day life. Fossil fuels satisfy more than 80% of the global energy demand, and the major economies of the present world are built around them (Veziroglu et al., 2007; Rusman and Dahari, 2016; Sun et al., 2018).The energy security offered by fossil fuels is ...
