Thermal energy storage provides a workable solution to this challenge. In a concentrating solar power (CSP) system, the sun's rays are reflected onto a receiver, which creates heat that is used to generate electricity that can be used immediately or stored for later use.

The data of the power plant were obtained for a period of 8 years (2010-2017) from CEGCO annual reports 20,21. Throughout the studied period, several major malfunctions occurred to the power plant.

A power station, also referred to as a power plant and sometimes generating station or generating plant, is an industrial facility for the generation of electric power. Power stations are generally connected to an electrical grid.. Many power stations contain one or more generators, rotating machine that converts mechanical power into three-phase electric power.

Other sources of thermal energy for storage include heat or cold produced with heat pumps from off-peak, lower cost electric power, a practice called peak shaving; heat from combined heat and power (CHP) power plants; heat produced by renewable electrical energy that exceeds grid demand and waste heat from industrial processes.

It was ensured that when the station was de-energized, a low-power steam turbine would use the remaining heat from the reactor to produce power for the NPP's own use. ...
