Today's EV batteries have longer lifecycles. Typical auto manufacturer battery warranties last for eight years or 100,000 miles, but are highly dependent on the type of batteries used for energy storage. Energy storage systems require a high cycle life because they are continually under operation and are constantly charged and discharged.

The NZE bar represents variability in demand if demand-side measures are taken to reduce battery and critical metal demand. Image credit: Global Supply Chains of EV Batteries report by IEA (CC BY 4.0). While SiB cannot provide the same energy density as LiB, sodium is 1000 times more abundant than lithium and therefore cheaper.

As an energy storage device, much of the current research on lithium-ion batteries has been geared towards capacity management, charging rate, and cycle times [9]. A BMS of a BESS typically manages the lithium-ion batteries' State of Health (SOH) and Remaining Useful Life (RUL) in terms of capacity (measured in ampere hour) [9]. As part of ...
