bio), Australia needs storage [18] energy and storage power of about 500 GWh and 25 GW respectively. This corresponds to 20 GWh of storage energy and 1 GW of storage power per million people.

High-temperature thermal energy storage integration into supercritical power plants was explored by Li et al. [15]. Zhao et al. [16] compared flexibility enhancement of "power to heat" and "auxiliary heat source" technologies, Richter et al. [17] discussed steam accumulator integration, and Cao et al. [18] proposed high ...

Thermal energy storages are applied to decouple the temporal offset between heat generation and demand. For increasing the share of fluctuating renewable energy sources, thermal energy storages are undeniably important. Typical applications are heat and cold supply for buildings or in industries as well as in thermal power plants.

DN Tanks constructs prestressed concrete tanks for thermal energy storage. Typical owners include: airports, schools and universities, hospitals, government and military bases, power plants and private industries. For expansion projects, owners can avoid the capital cost of adding an additional chiller by instead utilizing a TES tank.

Due to humanity's huge scale of thermal energy consumption, any improvements in thermal energy management practices can significantly benefit the society. One key function in thermal energy management is thermal energy storage (TES). Following aspects of TES are presented in this review: (1) wide scope of thermal energy storage field is discussed.

The integration of thermal energy storage (TES) systems in concentrated solar power (CSP) plants is a key factor to improve their competitiveness and overcome the intermittency of energy production. Currently, most planned or under construction CSP plants include integrated TES and their average storage capacity has been increasing [1] .
