The flywheel energy storage system works like a dynamic battery that stores energy by spinning a mass around an axis. Electrical input spins the flywheel hub up to a high speed and a standby charge keeps the unit spinning until its called upon to release . its energy. The energy is proportional to its mass and speed squared.

Reliability of power sources is an increasing challenge in many sectors and battery-backed uninterruptable power supplies (UPS) are one option to protect and keep electronic equipment operating in the event of grid power failure. The three major UPS configurations are offline (also called standby and battery backup), line-interactive and online double conversion. While online ...
