Key-Words: - Flywheel energy storage system, ISG, Hybrid electric vehicle, Energy management, Fuzzy logic control 1 Introduction Flywheel energy storage system (FESS) is different from chemical battery and fuel cell. It is a new type of energy storage system that stores energy by mechanical form and was first applied in the field of space industry.

EVs and HEVs can be further divided into six types of vehicles according to the demands of energy and power on vehicle batteries. Instead of grouping HEVs by vehicle architecture, it is more informative to group them by functionality of the electrical powertrain, which affects the fuel economy significantly.

The paper proposes the comparative study of two hybrids energy storage system (HESS) of a two front wheel driven electric vehicle. The primary energy storage is a Li-Ion battery, known for its high energy density. Whereas the secondary energy storage could be either an UC or a FES, chosen for their high power densities and cycle life.

The global electric car fleet exceeded 7 million battery electric vehicles and plug-in hybrid electric vehicles in 2019, and will continue to increase in the future, as electrification is an important means of decreasing the greenhouse gas emissions of the transportation sector. The energy storage system is a very central component of the electric vehicle. The storage system needs ...
