Dielectrics are essential for modern energy storage, but currently have limitations in energy density and thermal stability. Here, the authors discover dielectrics with 11 times the energy density of commercial alternatives at elevated temperatures.

In a nowadays world, access energy is considered a necessity for the society along with food and water [1], [2]. Generally speaking, the evolution of human race goes hand-to-hand with the evolution of energy storage and its utilization [3]. Currently, approx. eight billion people are living on the Earth and this number is expected to double by the year 2050 [4].

The selection of advanced energy storage is vital as the properties of base PCM largely depend on adding material on it. Although TC increased by using advanced energy storage material, but density and viscosity are also increased along this. There is also certain limit too, if the temperature further increases then TC will decrease.
