Among the storage systems reviewed by [9], compressed air energy storage (CAES) is listed as the second best technology after hydraulic pumps in terms of power and energy that can be stored and delivered within the system. Another advantage lies in their low energy related cost compared to batteries.

The combination of compressed air energy storage technology and vortex tube achieves low cost, high utilization of energy use, which can provide some new ideas for industrial production and is expected to be a major breakthrough technology in the development of energy storage technology. The main conclusions can be summarized as follows: 1)

MASCOT spring energy storage seal ring is a spring driven pressure auxiliary sealing device with PTFE jacket, in which a corrosion-resistant metal energy storage spring is specially equipped. When the MASCOT seal ring is installed in the seal groove, the spring is pressed to make the jacket lip close to the seal groove, thus forming a seal.
