A latent heat energy storage system (LHESS) can store energy during melting at a constant temperature, so the energy storage density of phase change materials (PCMs) is significantly higher than materials storing sensible energy [4]. Especially in applications that are limited in space, this advantage is of great importance.

Although the large latent heat of pure PCMs enables the storage of thermal energy, the cooling capacity and storage efficiency are limited by the relatively low thermal conductivity ( $\sim 1 \text{ W/(m} \cdot \text{K)}$ ) when compared to metals ( $\sim 100 \text{ W/(m} \cdot \text{K)}$ ). 8, 9 To achieve both high energy density and cooling capacity, PCMs having both high latent heat and high thermal ...
