The use-it-or-lose-it nature of many renewable energy sources makes battery storage a vital part of the global transition to clean energy. New power storage solutions can help decarbonize sectors ranging from data centres to road transport.

When a power source is connected, ions move towards the electrodes with opposite charges due to the electric field, without undergoing a chemical reaction [148]. This allows for efficient energy storage and release, without the degradation of the device over time, as seen in traditional batteries.
