What is Optical Storage. Optical storage is a technology that uses light to read and write data. It consists of a specially designed disk with reflective surfaces that interact with the laser beam in the optical drive. This process encodes information on the disk by creating variations in reflectivity.

The energy storage density of the MOST systems is higher than most latent heat energy storage systems, and can reach an energy density of up to 1 MJ/kg. [14] A potential benefit of the MOST systems for applications is that the MOST molecules change their chemical state throughout charging and discharging cycles but not the phase (unlike PCM).

Solar-thermal energy storage based on phase-change materials suffers from slow thermal-diffusion-based charging. Here the authors alleviate this issue by introducing optical absorbers and ...

Basic Principle. The recording/reading principle of the optical disk is that a highly coherent and monochromatic laser beam is focused on a near-diffraction-limited micro spot, and the micro-spot region on the recording medium produces physical or chemical changes that cause a change in the micro-area optical properties (such as refractive index and reflectivity, ...
