Thermal energy can be stored as sensible heat in a material by raising its temperature. The heat or energy storage can be calculated as.  $q = V r c p dt = m c p dt$  (1) where .  $q$  = sensible heat stored in the material (J, Btu)  $V$  = volume of substance (m<sup>3</sup>, ft<sup>3</sup>)  $r$  = density of substance (kg/m<sup>3</sup>, lb/ft<sup>3</sup>)  $m$  = mass of substance (kg, lb)

Energy can also be stored by making fuels such as hydrogen, which can be burned when energy is most needed. Pumped hydroelectricity, the most common form of large-scale energy storage, uses excess energy to pump water uphill, then releases the water later to turn a turbine and make electricity.

What is thermal energy storage? Thermal energy storage means heating or cooling a medium to use the energy when needed later. In its simplest form, this could mean using a water tank for heat storage, where the water is heated at times when there is a lot of energy, and the energy is then stored in the water for use when energy is less plentiful.
