Gravitational Potential Energy. The general expression for gravitational potential energy arises from the law of gravity and is equal to the work done against gravity to bring a mass to a given point in space. Because of the inverse square nature of the gravity force, the force approaches zero for large distances, and it makes sense to choose the zero of gravitational potential ...

Energy is stored by lifting blocks and stacking them at a height, then utilizing their gravitational potential energy to fall back to the ground and drive a generator. Standard systems are built with 35 MWh of storage and a power rating of 4 or 8 MW, consisting of a 150 meter high tower and up to 7,000 blocks.

These forms include mechanical, electrochemical, chemical, electrical, and thermal energy storage. Table 1 below gives a few common energy storage systems of each form. The main problem with gravitational storage is that it is incredibly weak compared to chemical, compressed air, or flywheel techniques (see the post on home energy storage options).For example, to get the amount of energy stored in a single AA battery, we would have to lift 100 kg (220 lb) 10 m (33 ft) to match it.

However, for all the benefits of pumped hydro, the technology remains geographically constrained. While it is built where it can be (most notable development is happening in China 3), grid operators are still examining
