The new technology would also be much more reliable and sustainable in its use of water, chemicals, and land than today's technology, according to a study published today in Matter by Stanford University researchers. Global demand for lithium has surged in recent years, driven by the rise of electric vehicles and renewable energy storage.

This sharp increase is driven mostly by the rapid adoption of electric vehicles and renewable energy storage systems, both of which rely heavily on batteries. Traditionally, lithium has been extracted from mined rocks, a method that is even more expensive, energy intensive, and driven by toxic chemicals than brine extraction.

Lithium demand is already high and is growing year over year. Over the next 10-20 years, lithium will be the most important natural resource in the world. As our society transitions to a fully sustainable future, EnergyX will tackle the hardest problems for the production of lithium and many aspects of energy storage.

The world needs lithium--a lot of it--for batteries in electric vehicles (EVs) and electricity storage. Lithium supply would need to grow sevenfold by 2030--which translates to opening 50 new lithium mines --to ...

An investigation from the Howard Center at Arizona State University uncovered the coming electric battery revolution in America will require billions upon billions of gallons of water to mine lithium. Many of the new U.S. mines will be ...

Lithium, the lightest element of all the metals, is a crucial resource for the United States' clean energy future: it's key in the production of lithium-ion rechargeable batteries, which are used to power electric vehicles and serve as home storage systems. While the U.S. is the largest consumer of lithium and will only increase its future consumption as it strives to meet ...

ases, metallurgical powders, polymers, and other industrial uses (35-plus percent). By 2030, batteries are expected to account for 95 percent of lithium demand, and total needs will grow annually by 25 to 26 percent to reach 3.3 million tons LCE depending on the scenarios outlined in Exhibit 2. Future lithium supply

Also known as "white gold" and "the new oil", lithium is a key ingredient in lithium-ion batteries that are used for green energy storage, including powering electric vehicles.

A new method for extracting lithium from briny water offers a more efficient, cost-effective, and environmental alternative to traditional lithium production. It could also help solve lithium ...

An increased supply of lithium will be needed to meet future expected demand growth for lithium-ion batteries for transportation and energy storage. Lithium demand has tripled since 2017 and is set to grow tenfold by 2050 under the International Energy Agency's (IEA) Net Zero Emissions by 2050 Scenario.

Stakeholders across the lithium supply chain--from mining companies to battery recycling companies--gathered to discuss, under Chatham House rule, its current state and barriers to growth. Increased supply of lithium is paramount for the energy transition, as the future of transportation and energy storage relies on lithium-ion batteries.

In late 2020, Elon Musk, head of the EV manufacturing giant Tesla, teased plans to launch a lithium-mining operation on US soil - also in Nevada - as the company seeks to secure a domestic supply chain for the batteries used in its vehicles.
